1.General Specification

The Features is described as follow:

■ Module dimension: 80.0 x 36.0 x 13.2 (max.) mm

■ View area: 66.0 x 16.0 mm

Active area: 56.20 x 11.5 mm

Number of Characters: 16 characters x 2 Lines

■ Dot size: 0.55 x 0.65 mm

■ Dot pitch: 0.60 x 0.70 mm

■ Character size: 2.95 x 5.55 mm

■ Character pitch: 3.55 x 5.95 mm

■ LCD type: VA Negative Transmissive

■ Duty: 1/16

■ View direction: 12 o'clock

■ Backlight Type: LED, Blue (High light)

■ IC:RW1063

2. Module Classification Information

^{*} Note: Please design the VOP adjustment circuit on customer's main board

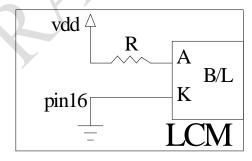

9.Backlight Information

Specification

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT	TEST CONDITION
Supply Current	ILED	_	45	60	mA	V=5.0V
Supply Voltage	V	4.9	5.0	5.1	V	- /
Reverse Voltage	VR	_	_	5	V	- 1
Luminance (Without LCD)	IV	210	280	_	CD/M ²	ILED=45mA
Wave Length	λр	465	470	475	nm	ILED=45mA
LED Life Time				\circ	>	ILED=45mA
(For Reference	_	_	50K	-	Hr.	25℃,50-60%RH,
only)) ′		(Note 1)
Color	Blue(high	light)				

Note: The LED of B/L is drive by current only, drive voltage is for reference only. drive voltage can make driving current under safety area (current between minimum and maximum).

Drive from Vdd, Pin 16

10.Reliability

Content of Reliability Test (Wide temperature, -20°C~70°C)

Environmental Test								
Test Item	Content of Test	Test Condition	Note					
High Temperature storage	Endurance test applying the high storage temperature for a long time.	200hrs	2					
Low Temperature storage	Endurance test applying the low storage temperature for a long time.	-30℃ 200hrs	1,2					
High Temperature Operation	Endurance test applying the electric stress (Voltage & Current) and the thermal stress to the element for a long time.	70℃ 200hrs						
Low Temperature Operation	Endurance test applying the electric stress under low temperature for a long time.	-20℃ 200hrs	1					
High Temperature/ Humidity storage	The module should be allowed to stand at 60°C,90%RH max For 96hrs under no-load condition excluding the polarizer, Then taking it out and drying it at normal temperature.	60℃,90%RH 96hrs	1,2					
Thermal shock resistance	The sample should be allowed stand the following 10 cycles of operation -20°C 25°C 70°C 30min 5min 30min 1 cycle	-20℃/70℃ 10 cycles						
Vibration test	Endurance test applying the vibration during transportation and using.	Total fixed amplitude: 1.5mm Vibration Frequency: 10~55Hz One cycle 60 seconds to 3 directions of X,Y,Z for Each 15 minutes	3					
Static electricity test	Endurance test applying the electric stress to the terminal.	VS=800V,RS=1.5kΩ CS=100pF 1 time						

Note1: No dew condensation to be observed.

Note2: The function test shall be conducted after 4 hours storage at the normal Temperature and humidity after remove from the test chamber.

Note3: The packing have to including into the vibration testing.

		12.11 Product dimension and structure must conform to product specification sheet.					
		12.12 Visual defect outside of VA is not considered to be rejection.					

12. Precautions in use of LCD Modules

- (1)Avoid applying excessive shocks to the module or making any alterations or modifications to it.
- (2)Don't make extra holes on the printed circuit board, modify its shape or change the components of LCD module.
- (3)Don't disassemble the LCM.
- (4)Don't operate it above the absolute maximum rating.
- (5)Don't drop, bend or twist LCM.
- (6)Soldering: only to the I/O terminals.
- (7)Storage: please storage in anti-static electricity container and clean environment.
- (8) Raystar have the right to change the passive components, including R3,R6 & backlight adjust resistors. (Resistors, capacitors and other passive components will have different appearance and color caused by the different supplier.)
- (9)Raystar have the right to change the PCB Rev. (In order to satisfy the supplying stability, management optimization and the best product performance...etc, under the premise of not affecting the electrical characteristics and external dimensions, Raystar have the right to modify the version.)

13. Material List of Components for RoHs

1. RAYSTAR Display Co., Ltd hereby declares that all of or part of products (with the mark "#"in code), including, but not limited to, the LCM, accessories or packages, manufactured and/or delivered to your company (including your subsidiaries and affiliated company) directly or indirectly by our company (including our subsidiaries or affiliated companies) do not intentionally contain any of the substances listed in all applicable EU directives and regulations, including the following substances.

Exhibit A: The Harmful Material List

Material	(Cd)	(Pb)	(Hg)	(Cr6+)	PBBs	PBDEs						
Limited 100 1000 1000 1000 1000 1000 1000 1000 ppm ppm												
Above limited value is set up according to RoHS.												

2.Process for RoHS requirement:

- (1) Use the Sn/Ag/Cu soldering surface; the surface of Pb-free solder is rougher than we used before.
- (2) Heat-resistance temp. :

Reflow: 250°C,30 seconds Max.;

Connector soldering wave or hand soldering : 320°C, 10 seconds max.

(3) Temp. curve of reflow, max. Temp. : 235±5°€;

Recommended customer's soldering temp. of connector : 280°C, 3 seconds.

14. Recommendable Storage

- 1. Place the panel or module in the temperature 25°C±5°C and the humidity below 65% RH
- 2. Do not place the module near organics solvents or corrosive gases.
- 3. Do not crush, shake, or jolt the module.

15.Other (IC Information)

1.Function Description

SYSTEM INTERFACE (Parallel 8-bit bus and 4-bit bus)

This chip has all four kinds interface type with MPU: IIC, 4SPI, 4-bit bus and 8-bit bus. Serial and parallel buses (4-bit/8-bit) are selected by IF1 and IF0 input pins, and 4-bit bus and 8-bit bus is selected by DL bit in the instruction register.

During read or write operation, two 8-bit registers are used. One is data register (DR); the other is instruction register (IR). The data register (DR) is used as temporary data storage place for being written into or read from DDRAM/CGRAM, target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically. So to speak, after MPU reads DR data, the data in the next DDRAM/CGRAM address is transferred into DR automatically. Also after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM automatically.

The Instruction register (IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data.

IR: Instruction Register.

DR: Data Register.

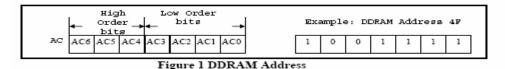

RS	R/W	Operation
0	0	Instruction write operation (MPU writes Instruction code into IR)
0	1	Read busy flag (DB7) and address counter (DB0 - DB6)
1	0	Data write operation (MPU writes data into DR
1	1	Data read operation (MPU reads data from DR)

BUSY FLAG (BF) (only support parallel 8-bit bus and 4-bit bus)

When BF = "High", it indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted. BF can be read, when RS = Low and R / W = High (Read Instruction Operation); through DB7 before executing the next instruction, be sure that BF is not High.

DISPLAY DATA RAM (DDRAM)

DDRAM stores display data of maximum 80 x 8 bits (80 characters). DDRAM address is set in the address counter (AC) as a hexadecimal number. (Refer to Figure 1.)

Since DDRAM has 8 bits data. It is possible to access 256 CGROM/CGRAM fonts.

1-line display (N = 0) (Figure 2)

When there are fewer than 80 display characters, the display begins at the head position. For example, if using only the Controller, 8 characters are displayed. See Figure 3.

When the display shift operation is performed, the DDRAM address shifts. See Figure 3.

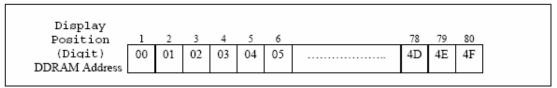

Figure 2 1-Line Display

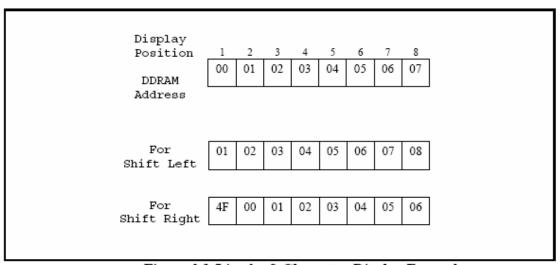

Figure 3 1-Line by 8-Character Display Example

2-line display (N = 1) (Figure 4)

Case 1: When the number of display characters is less than 40 x 2 lines, the two lines are displayed from the head. Note that the first line end address and the second line start address are not consecutive. For example, when just the Controller is used, 8 characters \dot{x} 2 lines are displayed. See Figure 5.

When display shift operation is performed, the DDRAM address shifts. See Figure 5.

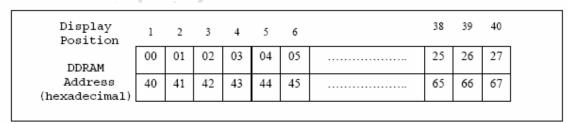

Figure 4 2-Lines Display

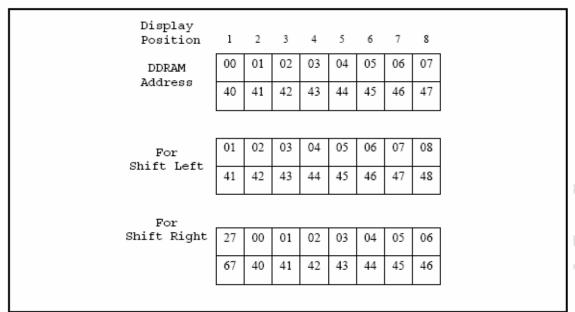

Figure 5 2-Lines by 8-Character Display Example

Case 2: For a 16-character x 2-line display, the Controller can be extended using one 40-output extension driver. See Figure 6.

When display shift operation is performed, the DDRAM address shifts. See Figure 6.

Figure 6 2-Lines by 16-Character Display Example

TIMING GENERATION CIRCUIT

Timing generation circuit generates clock signals for the internal operations.

ADDRESS COUNTER (AC)

Address Counter (AC) stores DDRAM/CGRAM address, transferred from IR.

After writing into (reading from) DDRAM/CGRAM/SEGRAM, AC is automatically increased (decreased) by 1.

When RS = "Low" and R/W = "High", AC can be read through DB0-DB6

CURSOR/BLINK CONTROL CIRCUIT

It controls cursor/blink ON/OFF and black/white inversion at cursor position.

LCD DRIVER CIRCUIT

LCD Driver circuit has 16 common and 40 segment signals for 2-line display (N=1) or 8 common and 40 segments for 1-line display (N=0) for LCD driving.

Data from CGRAM/CGROM is transferred to 40 bit segment latches serially, and then it is stored to 40 bit shift latch.

CGROM (CHARACTER GENERATOR ROM)

CGROM has 10,240 bits (256 characters x 5 x 8 dot)

CGRAM (CHARACTER GENERATOR RAM)

CGRAM has up to 5 _ 8 dots 8 characters. By writing font data to CGRAM, user defined character can be used (refer to Table 2).

5 x 8 dots Character Pattern

Table 2. Relationship between Character Code (DDRAM) and Character Pattern (CGRAM)

	Char	acter	Code	(DD	RAM	I data)	CGRAM Address						CGRAM Data						Pattern		
D7	D6	D5	D4	D3	D2	D1	D0	Α5	Α4	А3	A2	Α1	Α0	P7	P6	P5	P4	P3	P2	P1	P0	Number

-	-	-	-	-	0	0	0	-	-	-	0	1	0	-	-	-	1	0	0	0	1	
-	-	-	-	-	0	0	0	-	-	-	0	1	1	-	-	-	1	1	1	1	1	
-	-	-	-	-	0	0	0	-	-	-	1	0	0	-	-	-	1	0	0	0	1	
-	-	-	-	-	0	0	0	-	-	-	1	0	1	-	-	-	1	0	0	0	1	
-	-	-	-	-	0	0	0	-	-	-	1	1	0	-	-	-	1	0	0	0	1	
-	-	-	-	-	0	0	0	Ŀ	-	-	1	1	1	-	-	-	0	0	0	0	0	
				-					-			-						-				
				-				_	-			-						-				
0	0	0	0	0	1	1	1	1	1	1	0	0	0	Х	X	Х	1	0	0	0	1	Pattern 8
-	-	-	-	-	1	1	1	-	-	-	0	0	1	-	-	-	1	0	0	0	1	
-	-	-	-	-	1	1	1	-	-	-	0	1	0	-	-	-	1	0	0	0	1	
-	-	-	-	-	1	1	1	-	-	-	0	1	1	-	-	-	1	1	1	1	1	
-	-	-	-	-	1	1	1	-	-	-	1	0	0	-	-	-	1	0	0	()	1	
-	-	-	-	-	1	1	1	-	-	-	1	0	1	-	-	-	1	0	0	0	1	
-	-	-	-	-	1	1	1	-	-	-	1	1	0	-	-	-	1	0	0	0	1	
-	-	-	-	-	1	1	1	۱.	-	-	1	1	1	-	-	-	0	0	0	0	0	

Notes:

- 1. Character code bits 0 to 2 correspond to CGRAM address bits 3 to 5 (3 bits: 8 types).
- 2. CGRAM address bits 0 to 2 designate the character pattern line position. The 8th line is the cursor position and its display is formed by a logical OR with the cursor. Maintain the 8th line data, corresponding to the cursor display position, at 0 as the cursor display. If the 8th line data is

- 1, 1 bit will light up the 8th line regardless of the cursor presence.
- 3. Character pattern row positions correspond to CGRAM data bits 0 to 4 (bit 4 being at the left).
- 4. As shown Table 2, CGRAM character patterns are selected when character code bits 4 to 7 are all 0 and MW=0. However, since character code bit 3 has no effect, the H display example above can be selected by either character code 00H or 08H.
- 5. 1 for CGRAM data corresponds to display selection and 0 to non-selection.
- "-": Indicates no effect.

2.Instruction Table

Instruction	RS	RW	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	Description Time (540KHz)

Clear Display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	0	0	0	0	0	1	l

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status; namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

Return Home:

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
Γ	0	0	0	0	0	0	0	0	1	Х	1

Return Home is cursor return home instruction. Set DDRAM address to "00H" into the address counter. Return cursor to its original site and return display to its original status, if shifted. A content of DDRAM does not change.

Entry Mode Set:

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	S

Set the moving direction of cursor and display.

I/D: Increment/decrement of DDRAM address (cursor or blink)

I/D = 1: cursor/blink moves to right and DDRAM address is increased by 1.

I/D = 0: cursor/blink moves to left and DDRAM address is decreased by 1.

* CGRAM operates the same as DDRAM, when read/write from or to CGRAM

S: Shift of entire display

When DDRAM read (CGRAM read/write) operation or S = "Low", shift of entire display is not performed.

If S= "High" and DDRAM write operation, shift of entire display is performed according to I/D value (I/D = "1": shift left, I/D = "0": shift right).

s	I/D	Description					
Н	Н	Shift the display to the left					
H L		Shift the display to the right					

Display ON/OFF

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
ı	0	0	0	0	0	0	1	D	С	В

Control display/cursor/blink ON/OFF 1 bit register.

D: Display ON/OFF control bit.

D = 1: entire display is turned on.

D = 0: display is turned off, but display data is remained in DDRAM.

C: Cursor ON/OFF control bit.

C = 1: cursor is turned on.

C = 0: cursor is disappeared in current display, but I/D register remains its data.

B: Cursor Blink ON/OFF control bit.

B = 1: cursor blink is on, that performs alternate between all the high data and display character at the cursor position. If fosc has 540 kHz frequency, blinking has 185 ms interval.

B = 0: blink is off.

Cursor or Display Shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	-	-

Without writing or reading of display data, shift right/left cursor position or display. This instruction is used to correct or search display data (refer to Table 4). During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1st line.

Note that display shift is performed simultaneously by the shift enable instruction. When displayed data is shifted repeatedly, all display lines shifted simultaneously. When display shift is performed, the contents of address counter are not changed.

Table 4. Shift Patterns According to S/C and R/L Bits

S/C	R/L	Operation			
0	0	Shift cursor to the left, address counter is decreased by 1			
Shift cursor to the right, address counter is increased by 1					
1	0	Shift all the display to the left, cursor moves according to the display			
1	1	Shift all the display to the right, cursor moves according to the display			

Function Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	F	Х	Х

DL: Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it needs to transfer 4-bit data by two times.

IF using IIC and 4-SPI interface DL bit must be setting to "1"

N: Display line number control bit

When N = "Low", it means 1-line display mode.

When N = "High", 2-line display mode is set.

F: Display font type control bit

When F = "Low", it means 5 x 8 dots format display mode

When F = "High", 5 x11 dots format display mode.

N	F	No. of Display Lines	Character Font	Duty Factor
L	L	1	5x8	1/8
L	Н	1	5x11	1/11
Н	x	2	5x8	1/16

Set CGRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

Set DDRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	l

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode (N=0), DDRAM address is from "00H" to "4FH"

In 2-line display mode (NW = 0), DDRAM address in the 1st line is from "00H" - "27H", and DDRAM address in the 2nd line is from "40H" - "67H".

Read Busy Flag and Address (only support parallel 8-bit bus and 4 bit bus)

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
- [0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	1

This instruction shows whether Controller is in internal operation or not. If the resultant BF is "high", it means the internal operation is in progress and you have to wait until BF to be Low, and then the next instruction can be performed. In this instruction you can read also the value of address counter.

Write Data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM/SEGRAM.

The selection of RAM from DDRAM, CGRAM, is set by the previous address set instruction: DDRAM address set, CGRAM address set. RAM set instruction can also determine the AC direction to RAM.

After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

Read Data from RAM (only support parallel 8-bit bus and 4 bit bus)

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Г	1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM.

The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, because the direction of AC is not determined.

If you read RAM data several times without RAM address set instruction before read operation, you can get correct RAM data from the second, but the first data would be incorrect, because there is no time margin to transfer RAM data.

In case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction: it also transfer RAM data to output data register. After read operation address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM read operation, display shift may not be executed correctly.

* In case of RAM write operation, after this AC is increased/decreased by 1 like read operation. In this time, AC indicates the next address position, but you can read only the previous data by read instruction.

OUTLINE

To overcome the speed difference between internal clock of Controller and MPU clock, Controller performs internal operation by storing control information to IR (Instruction Register) or DR (data Register).

The internal operation is determined according to the signal from MPU, composed of read/write and data bus.

I Nstruction can be divided largely four kinds;

- *Controller function set instructions (set display methods, set data length, etc.)
- *Address set instructions to internal RAM
- *Data transfer instructions with internal RAM
- *Others

The address of internal RAM is automatically increased or decreased by 1.

NOTE: During internal operation, Busy Flag (DB7) is read high. Busy Flag check must be preceded the next instruction.

Busy flag check must be proceeded the next instruction.

When an MPU program with Busy Flag (DB7) checking is made, 1/2 Fosc (is necessary) for executing the next instruction by the falling edge of the "E" signal after the Busy Flag (DB7) goes to "Low".

INTERFACE WITH MPU

Controller can transfer data in bus mode (4-bit or 8-bit) or serial mode with MPU.

In case of 4-bit bus mode, data transfer is performed by two times to transfer 1 byte data.

. When interfacing data lengths are 4-bit, only 4 ports, from DB4 - DB7, are used as data bus. At first higher 4-bit (in case of 8-bit bus mode, the contents of DB4 - DB7) are transferred, and then lower 4- bit (in case of 8-bit bus mode, the contents of DB0 - DB3) are transferred. So transfer is performed by two times.

Busy Flag outputs "High" after the second transfer are ended.

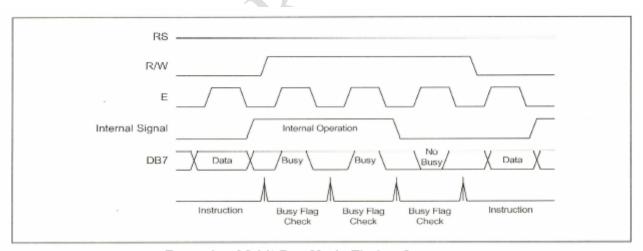

- . When interfacing data length are 8-bit, transfer is performed at a time through 8 ports, from DB0 DB7.
 - Interface is selected by IF1,IF0 pins (refer to Bonding Note for IF1, IF0 on Page 10)

IF1	IF0	Interface select		
open	open	6800 8/4 bit		
open	Bonding to VDD	IIC		
Bonding to VDD	open	4-line SPI		

INTERFACE WITH MPU IN BUS MODE

Interface with 8-bit MPU

If 8-bits MPU is used, Controller can connect directly with that. In this case, port E, RS, R/W and DB0 to DB7 need to interface each other. Example of timing sequence is shown below.

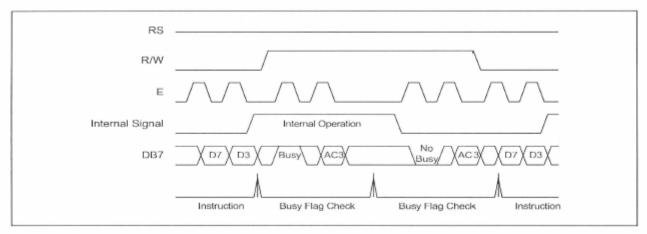

Example of 8-bit Bus Mode Timing Sequence

Interface with 4-bit MPU

If 4-bit MPU is used, Controller can connect directly with this. In this case, port E, RS, R/W and DB4 - DB7 need to interface each other. The transfer is performed by two times. Example of timing sequence is shown below.

Example of 4-bit Bus Mode Timing Sequence

INITIALIZING

INITIALIZING BY INTERNAL RESET CIRCUIT

When the power is turned on, Controller is initialized automatically by power on reset circuit. During the initialization, the following instructions are executed, and BF (Busy Flag) is kept "High" (busy state) to the end of initialization.

Clear Display Instruction

Write "20H" to all DDRAM

Set Functions Instruction

DL = 1: 8-bit bus mode

N = 0: 1-line display

 $F = 0: 5 \times 8$ dot character font

Display ON/OFF Instruction

D = 0: Display OFF

C = 0: Cursor OFF

B = 0: Blink OFF

Set Entry Mode Instruction

I/D = 1: Increment by 1

S = 0: No entire display shift

Note:

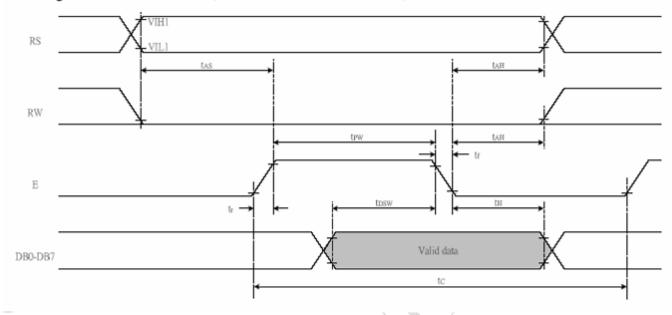

If the electrical characteristics conditions listed under the table Power Supply Conditions Using Internal Reset Circuit are not met, the internal reset circuit will not operate normally and will fail to initialize the Controller. For such a case, initialization must be performed by the MPU as explain by the following figure.

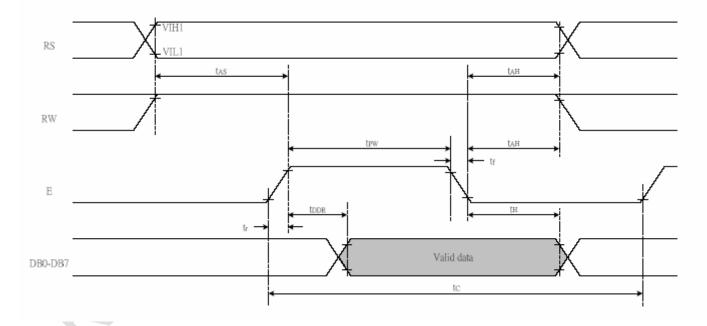

3.Timing Characteristics

Timing Characteristics

Writing data from MPU to IC (Parallel 8-bit bus and 4-bit bus)

Reading data from IC to MPU(Parallel 8-bit bus and 4-bit bus)

In 6800 interface (TA = 25° C, VDD = 2.7V)

Write Mode (Writing data from MPU to IC)								
T _C	Enable Cycle Time	Pin E (except clear display)	1000	1	-	ns

TAS	Address Setup Time	Pins: RS,RW,E	60	-	-	ns		
T_{AH}	Address Hold Time	Pins: RS,RW,E	20		-	ns		
T_{DSW}	Data Setup Time	Pins: DB0 - DB7	195	,	-	ns		
T_{H}	Data Hold Time	Pins: DB0 - DB7	10	-	-	ns		
Read Mode (Reading Data from IC to MPU)								
Tc	Enable Cycle Time	Pin E	1000	,	-	ns		
T_{PW}	Enable Pulse Width	Pin E	450		-	ns		
T_R, T_F	Enable Rise/Fall Time	Pin E	-	-	25	ns		
TAS	Address Setup Time	Pins: RS,RW,E	60	-	-	ns		
T_{AH}	Address Hold Time	Pins: RS,RW,E	20	-	-	ns		
T_{DDR}	Data Setup Time	Pins: DB0 - DB7	-	-	360	ns		
T_{H}	Data Hold Time	Pins: DB0 - DB7	5	-	-	ns		

In 6800 interface (TA = 25° C, VDD = 5V)

—									
Write Mode (Writing data from MPU to IC)									
T_{C}	Enable Cycle Time	Pin E (except clear display)	500	-	-	ns			
T_{PW}	Enable Pulse Width	Pin E	230	-	-	ns			
T_R, T_F	Enable Rise/Fall Time	Pin E	-	-	20	ns			
T_{AS}	Address Setup Time	Pins: RS,RW,E	40	-		ns			
T_{AH}	Address Hold Time	Pins: RS,RW,E	10	-	-	ns			
T_{DSW}	Data Setup Time	Pins: DB0 - DB7	80	-		ns			
$T_{\mathtt{H}}$	Data Hold Time	Pins: DB0 - DB7	10	-	-	ns			
Read Mode (Reading Data from IC to MPU)									
T_{C}	Enable Cycle Time	Pin E	500	-		ns			
T_{PW}	Enable Pulse Width	Pin E	230	-		ns			
T_{R},T_{F}	Enable Rise/Fall Time	Pin E	-	-	20	ns			
T_{AS}	Address Setup Time	Pins: RS,RW,E	40	-	-	ns			
T_{AH}	Address Hold Time	Pins: RS,RW,E	10	-	-	ns			
T_{DDR}	Data Setup Time	Pins: DB0 - DB7	-	-	120	ns			
$T_{\rm H}$	Data Hold Time	Pins: DB0 - DB7	10	-	-	ns			

4. Initializing of LCM

Serial Interface Mode(Fosc=540KHz)
